Assignment \Rightarrow 4

NORMALIZATION

1. Product - Info

| | | | | |
|----------|----|---------|------|-------------------|
| Model No | CP | Remarks | Desc | <u>Product ID</u> |
|----------|----|---------|------|-------------------|

Functional Dependencies \Rightarrow

$\text{Product ID} \rightarrow \{ \text{Model No}, \text{CP}, \text{Remarks}, \text{Desc} \}$

\Rightarrow As product ID is a superkey, so relation is in Boyce Codd Normal Form.

2. Order - Dtls

| | | | | | |
|---------------|-----|----------|----------------|------------|-----------------|
| <u>ItemNo</u> | Qty | Discount | Price per item | Product ID | <u>Order ID</u> |
|---------------|-----|----------|----------------|------------|-----------------|

Functional Dependencies \Rightarrow

$^* [\text{Order ID} \rightarrow \{ \text{Order data}, \text{status}, \text{client ID} \}]^*$

$^* [\Rightarrow \text{Order ID is a superkey}]^*$

$^* [\text{Our relation}]^*$

$\{ \text{Order ID}, \text{ITEMNO} \} \rightarrow \{ \text{Qty}, \text{Discount}, \text{price per item}, \text{product ID} \}$

\Rightarrow As $(\text{Order ID} + \text{ITEMNO})$ is a super key, so our relation is in Boyce Codd Normal form.

3. Order_Info

| | | | |
|------------|--------|-----------------|-----------|
| Order data | Status | <u>Order ID</u> | Client ID |
|------------|--------|-----------------|-----------|

Diagram showing functional dependencies for Order_Info: Arrows point from Order ID to Order data, Status, and Client ID.

Functional Dependencies: \rightarrow

$\text{Order ID} \rightarrow \{ \text{Order Data}, \text{Status}, \text{Client ID} \}$

\Rightarrow Order ID is a superkey, so relation is in Boyce Codd Normal Form.

4. Fulfilled

| | | |
|------------|-----------|-----------------|
| Pay-Method | Delv-Date | <u>Order ID</u> |
|------------|-----------|-----------------|

Diagram showing functional dependencies for Fulfilled: Arrows point from Order ID to Pay-Method and Delv-Date.

Functional Dependencies: \rightarrow

$\text{Order ID} \rightarrow \text{Delv-Date}$

$\text{Order ID} \rightarrow \text{Pay-Method}$

\Rightarrow As Order ID is a superkey. Therefore, relation is in Boyce-Codd Normal Form.

5. In Progress

| | |
|---------------|-----------------|
| Exp-Delv Date | <u>Order ID</u> |
|---------------|-----------------|

Diagram showing functional dependencies for In Progress: An arrow points from Order ID to Exp-Delv Date.

$\text{Order ID} \rightarrow \text{Exp-Delv Date}$

\Rightarrow As Order ID is a superkey, so relation is in Boyce-Codd Normal Form.

6. Client

| | |
|----------|-----------|
| Login-ID | Client-ID |
|----------|-----------|

↑

Functional Dependencies : \rightarrow $\text{Client-ID} \rightarrow \{\text{Login-ID}\}$

\Rightarrow As Client-ID is superkey, so our relation is in Boyce-Codd Normal Form.

7. Individual

| | | | | | | | | | |
|-------|--------|--------|--------|---------|------|-------|---------|------------------|-------------------|
| B-day | F-name | M-name | L-name | Str-No. | City | State | Pincode | <u>Client-ID</u> | <u>Address No</u> |
|-------|--------|--------|--------|---------|------|-------|---------|------------------|-------------------|

↑ ↑ ↑ ↑ ↑ ↑ ↑ ↑ |

Functional Dependencies : \rightarrow

$\text{Address No} \rightarrow \{\text{B-day, F-name, M-name, L-name, Str-no, City, State, Pincode}\}$

$\text{Client No} \rightarrow \{\text{B-day, F-name, M-name, L-name, Str-no, City, State, Pincode}\}$

$\text{Pincode} \rightarrow \{\text{City, State}\}$

(a) Pincode is not a superkey, so our relation is not in Boyce-Codd Normal Form

(b) City and State are not prime attributes, so our relation is not in third normal form.

(c) Every non-prime attribute is fully functionally dependent on super key. Therefore, our relation is in second Normal form.

8. Firm

| F-name | M-name | L-name | Srt-no | city | state | Pincode | Reg-NO | Client-ID |
|--------|--------|--------|--------|------|-------|---------|--------|-----------|
| ↑ | ↑ | ↑ | ↑ | ↑ | ↑ | ↑ | | ↑ |
| ↑ | ↑ | ↑ | ↑ | ↑ | ↑ | ↑ | | |
| | | | | ↑ | ↑ | | | |

Reg-NO $\rightarrow \{ \text{F-name, M-name, L-name, Srt-no, city, state, pincode, client-no} \}$

Client-NO $\rightarrow \{ \text{F-name, M-name, L-name, Srt-no, city, state, pincode} \}$

Pincode $\rightarrow \{ \text{city, state} \}$

\Rightarrow Here we can see that pincode is not super key, hence our relation is not in BCNF.

\Rightarrow City and state are not prime attributes, therefore our relation is not in 3rd normal form.

\Rightarrow In the relation, every non-prime attribute is fully functionally dependent on super key, therefore our relation is in 2nd normal form.

9. Mobil.No \rightarrow

| Mobil.No | Address-No |
|----------|------------|
| ↑ | |

Functional Dependencies: \rightarrow

Mobil.No \rightarrow Address-No.

\Rightarrow As Mobil.No is super key, this relation is in BCNF.

10

Email-ID

Functional Dependencies \rightarrow

$\text{Reg-No} \rightarrow \{ \text{Email-ID} \}$

\Rightarrow Here, Reg-No is a superkey, therefore our relation is in Boyce-Codd Normal Form.
